ProofPocket API
deploy.sh admins EMAIL…
insert users (role admin, must_change_password, expires in 7 days), existing emails skipped
created / skipped (emails only, no secrets in logs)
set temporary passwords (runs locally)
create or update user (random 16+ chars, mixed case, digits, symbols)
email + temporary password table, printed once
Sign in with the temporary password
signInWithEmailAndPassword
GET /me → mustChangePassword: true
Change password screen (nothing else reachable)
Temporary + new password
POST /auth/password (fresh sign-in, password rules, new ≠ temporary)
updateUser(uid, password)
password_changed() clears the flag, audit user.password_changed
Sign in again with the new password (temporary one no longer works)
Google Authenticator set-up, then the admin portal
Expired (after 7 days): every request is refused with temp_password_expired until the operator re-issues one
